

# Tunnel Vision

**9430 Area Lighting Systems** were recently used by West Yorkshire Fire & Rescue Service to illuminate the scene of a derailed train in the Summit Tunnel at Todmorden, West Yorkshire.

## Instant Light

The 9430s were easily carried down the tunnel to the incident scene and instantly illuminated the area. With 2000 lumens of light from each unit, the emergency services were able to safely evacuate the passengers and lead them out of the tunnel.

Chris Clark, head of The Fire Investigation unit at West Yorkshire Fire & Rescue Service commented that the 9430 Area light is “robust, portable with exceptional battery life”. They have used Peli 9430 lighting systems for many incidents and Brian Saville, head of Visual Services, said “the light is of perfect colour balance and good saturation for the use of video and stills at any incident scene, it is also easy to clean and this avoids any cross contamination of incidents”.
